

Counterbalance Forklift Training Chandler

Counterbalance Forklift Training Chandler - Counterbalance Forklift Training courses are always in high demand. The Counterbalance forklift is a forklift that is designed along with a weight which counters the balance, evenly spreading the weight of the load across the forklift arms. Counterbalance forklifts are designed so the weight behind the center of gravity is counterbalanced by the weight on the lift. The load is projected out from the equipment's front so it is visible to the operator of the forklift. This type of forklift truck must just be used on prepared surface or on level, stable ground.

Training is necessary for forklift operators to know the correct method to spread the load evenly across the arms of the forklift. Trainees will learn how to lower and raise the load vertically and how to tilt the forklift mast both backwards and forwards between 5 and 15 degrees. Trainees will be taught the RTITB standards needed for operating the forklift safely. Trainees will also become familiar with the types of attachments for the arms of the forklift.
